

1. Build your box to either rest on the sidewalls of the sluice or build a leg kit to suspend it.
2. Drill for dowel rod, attach back flange board ( Inner Wall )
3. Place grating ( shopping cart sidewall, cookie sheet with 10,000 holes etc. )
4. Attach Mesh to underside top box ( You could drill holes and run dowels also? )
- 4a. Attach standard door hinge on outside back wall ( hinge the two halves for dumping )
5. If a leg kit is used to suspend the grizzly over the entry point of the sluice  
 You can only attach the legs to the Lower box.

\*Note....You can use a 1/2" EMT pipe strap to hold the grating to the back flange  
 this will aid in easy removal.....keep it simple, build it well
